

Setting up SASS - 3 Ways

Create a project folder

These instructions will assume a project folder w/ the following structure:

yourproject

- index.html
- stylesheets
 - main.scss

Command Line

1. Follow instructions in the right-hand column of <http://sass-lang.com/install>
2. Navigate to your project folder
3. Run `sass --watch stylesheets:css`. This will compile .scss files in the `stylesheets` folder and turn them into .css files in the `css` folder.
4. Add `<link rel="stylesheet" href="css/main.css">` to your index.html. It's important that you link to a .css file, not an .scss file.

Sublime Text

1. Open Tools -> Command Palette -> Package Control: Install Package
2. Install SASS package
3. Repeat and install SASS Build package
4. Hit Ctrl-B inside a SASS file (in Sublime) to compile it - it will compile into the same folder where it lives 4b. If this doesn't work, it probably means that Sublime can't find SASS on your \$PATH. To fix this, do `which sass` and then paste the result into `sudo ln -s RESULT_HERE /usr/local/bin/sass`. This will create a "symlink" so Sublime can find sass in your `/usr/local/bin` folder.
5. Add `<link rel="stylesheet" href="stylesheets/main.css">` to your index.html.

Koala (Free GUI)

1. Download Koala from <http://koala-app.com/>
2. Drag your project folder into Koala
3. Sass files should compile automatically into the same folder where they live
4. Add `<link rel="stylesheet" href="stylesheets/main.css">` to your index.html.
